Test method(s):

<Safety and Technical Standards for Cosmetics> (2015) Chapter 8 Part 6 Test Method for Efficacy Measurement of Anti-hair Loss Cosmetic Products (Annex 8 of the National Medical Products Administration No. 17 in 2021)

Conclusion:

The test result indicated under this test condition the test sample had anti-hair loss effect.

This test report is in English and maybe translated into other languages. The Chinese version shall prevail.

Report No. SHCPCH230700481S1 EN dated May 23 2024 issued by SGS-CSTC Standards Technical Services (Shanghai) Co., Ltd. Testing Center was repealed and ame nded by this report. The report was updated the content of sample name.

Unless otherwise stated the results shown in this test report refer only to the sample(s) tested. The results cannot be used for improper publicity. Not be allowed to copy testing report except for copy of tull text) without written approval of the company.

Material and method

1.1. Test sample

Test sample: Cosmetics final product

Control sample: Matrix formula product without anti-hair loss ingredients, parallel testing with the test sample, total 56 bottles (include the number of wash-out period sample of control sample group)

Wash-out period sample: Same as the control sample, the test sample group and the control sample group both used this sample during the wash-out period, total 32 bottles (only include the number of wash-out period sample of test sample group)

1.2. Subjects

Total 63 subjects joined the test, 1 subject exited the test because of his/her own reason, finally 62 subjects completed the test; there's 32 subjects joined the test sample group, included 30 females and 2 males, aged from 22 to 60 years old, mean age was 42.6±8.5 years old; there's 30 subjects joined the control sample group, included 28 females and 2 males, aged from 26 to 59 years old, mean age was 43.1±7.8 years old. All met the inclusion and exclusion criteria.

1.3. Test instrument and equipment

Professional digital camera: Canon 90D Dermoscopy: Dermo Scan, GmbH

1.4. Test environment

The test was developed in the constant environment with 21±1 ℃ temperature and 50±10%RH relative humidity, and the visual evaluation was carried under the constant light (LED light or fluorescent tubes with color temperature of 5500-6500K). All subjects should rest at least 30 minutes in this environment before tool visual evaluation or instrument measurements.

1.5. Test methods

Recruiting the enrolled subjects as required and signed informed consent. Ask subjects a serious of questions about the disease history, health status, etc. according to the inclusion and exclusion criteria before enrolled the test. At the same time combed the hair with 60 times comb hair method, counted the hair loss and recorded.

Qualified subjects used the wash-out period sample for 2 weeks.

At the end of wash-out period the technician combed the hair with 60 times comb hair method, counted the hair loss and recorded. The count of hair loss more than 10 roots was included the study. Qualified subjects were split into the test sample group and control sample group according to the stratified random method, to ensure the balance of important factors that might affect the result (gender, age, hair length, severity of hair loss etc.).

Evaluated the baseline value of qualified subjects, included the count of hair loss, hair density (visual) and image capture and recorded. 4 weeks after application, 8 weeks after application, 12 weeks after application, evaluated again and recorded.

Page 3 of 12

1.6. Product usage method

The technician distributed the test sample and control sample to subjects according to the random table, introduced the usage method to ensure subjects could use the sample correctly. The sample was used for 12 weeks.

1.7. Statistical analysis

The test results were statistically analyzed by SPSS Statistics 28.0. The measurement data is expressed as: mean ± standard deviation and carried out the normal distribution test. It meets the requirements of normal distribution, used self-comparison before and after by the paired t-test, otherwise, the rank sum test of two related samples was used; the rank sum test of two related samples was used to compare before and after the grade data; the independent sample t test or rank sum test is used for comparison between the test area and the control area and the significance level was α =0.05.

1.8. Test conclusion judgement

According to the test result, at any time point, the count of hair loss increased non-significantly compared with before application, or the change value (test value after application - test value before application) of the count of hair loss of the test sample group was significantly lower than the control sample group (p<0.05), or the hair density (overall hair density or part hair density) decreased nonsignificantly compared with before application, or the change value (test value after application – test value before application) of the count of hair density of the test sample group was significantly higher than the control sample group (p<0.05), then the test sample was considered to have anti-hair loss effect, otherwise not have anti-hair loss effect.

Remarks: * means there's a significant difference in the change value compared with the control sample group, p<0.05.

3. **Test conclusion**

Compared with before application, by using test samples, 4 weeks after application, 8 weeks after application and 12 weeks after application, the count of hair loss all decreased significantly (p<0.05), the part hair density and overall hair density all increased significantly (p<0.05).

Compared with the control sample group, by using test samples, 4 weeks after application, 8 weeks after application and 12 weeks after application, the change value of the count of hair loss of the test sample group was all significantly lower than the control sample group (p<0.05); 8 weeks after application and 12 weeks after application, the change value of the part hair density of the test sample group was both significantly higher than the control sample group (p<0.05); 4 weeks after application, 8 weeks after application and 12 weeks after application, the change value of the overall hair density of the test sample group was all higher than the control sample group (p<0.05).

The test result indicated under this test condition the test sample had anti-hair loss effect.

Table 8 Result of the change value between the test sample group and control sample group

Parameter	After application	p value compared with the control sample group
	4 weeks	0.012
Count of hair count	8 weeks	0.012
	12 weeks	0.016
	4 weeks	0.460
Part hair density	8 weeks	0.007
	12 weeks	0.003
	4 weeks	0.755
Overall hair density (visual)	8 weeks	0.004
	12 weeks	<0.001
	4 weeks	<0.001
Overall hair density (image)	8 weeks	0.005
	12 weeks	<0.001
	4 weeks	<0.001
Overall hair density (mean)	8 weeks	<0.001
	12 weeks	<0.001

Remarks: There's a significant difference (p<0.05). There's no significant difference (p≥0.05)

Table 9 Improved subjects and improved percentage of subjects

Sample	Parameter	Improved subjects (Improved percentage of subjects)		
		4 weeks	8 weeks	12 weeks
Test sample	Count of hair count	26(81.25%)	31(96.88%)	32(100.00%)
	Part hair density	24(75.00%)	27(84.38%)	30(93.75%)
	Overall hair density (visual)	2(6.25%)	16(50.00%)	25(78.13%)
	Overall hair density (image)	20(62.50%)	15(46.88%)	18(56.25%)
	Overall hair density (mean)	21(65.63%)	24(75.00%)	28(87.50%)
Control sample	Count of hair count	19(63.33%)	25(83.33%)	30(100.00%)
	Part hair density	20(66.67%)	20(66.67%)	22(73.33%)
	Overall hair density (visual)	4(13.33%)	6(20.00%)	9(30.00%)
	Overall hair density (image)	3(10.00%)	7(23.33%)	4(13.33%)
	Overall hair density (mean)	6(20.00%)	10(33.33%)	12(40.00%)
